NETWORK & CLOUD LAB

- Built a cloud lab that simulated an AWS environment connecting to an on-premises environment with a highly available and dynamic accelerated site-to-site VPN.
- The AWS environment was created with 2 subnets, 2 EC2 instances, a VPC attachment and TGW. The simulated on-premises environment contained 1 public subnet with 2 Ubuntu endpoints and strongSwan.
- Instead of creating a static VPN, I used a BGP to dynamically exchange routes between the simulated on-premises environment and transit gateway.
